<sup>\*</sup> O3 = Ozone CO = Carbon Monoxide PM-10 = Particles 10 microns & smaller PM-2.5 = Particles smaller than 2.5 microns \*"Ozone Health Watch" means that the highest concentration of OZONE may <u>approach</u> the federal health standard. "PM-10 or PM-2.5 Health Watch" means that the highest concentration of PM-10 or PM-2.5 may <u>approach</u> the federal health standard. "High Pollution Advisory" means that the highest concentration of OZONE, PM-10, or PM-2.5 may <u>exceed</u> the federal health standard. "DUST" means that short periods of high PM-10 concentrations caused by outflow from thunderstorms are possible.

| Tuesday, 03/25/2014   | Unusually sensitive people should consider reducing prolonged or heavy exertion outdoors.                               |  |
|-----------------------|---|--|
| Wednesday, 03/26/2014 | Active children and adults and people with respiratory disease such as asthma should limit prolonged exertion outdoors. |  |

#### SYNOPSIS AND DISCUSSION

### ...A PM-10 HIGH POLLUTION ADVISORY HAS BEEN ISSUED FOR WEDNESDAY...

The weather system that will bring winds to Arizona has strengthened a little more. Phoenix could see sustained winds between 15 and 25 mph at times with gusts as high as 35 mph. This is more than enough to generated blowing dust locally. In addition, we anticipate dust from dry deserts to the west (Yuma/southern California). We can lean on any precipitation to help minimize impacts as they disturbance will be dry. Erring on the side of caution, we are going with a High Pollution Advisory for Wednesday as it is highly possible that PM10 concentrations could exceed the standard. Wind conditions improve Thursday and dust levels should also settle into the lower Moderate range.

Daytime highs are expected to briefly fall into the lower 70 on Thursday, but rapidly warm to the upper 80s by Sunday.

Check back tomorrow for more. Until then, have a good day! -J.Paul

#### DESCRIPTION OF LOCAL AIR POLLUTANTS IN DETAIL

### O3 (OZONE):

#### **Description** -

This is a secondary pollutant that is formed by the reaction of other primary pollutants (precursors) such as VOCs (volatile organic compounds) and NOx (Nitrogen Oxides) in the presence of heat and sunlight.

<u>Sources</u> – VOCs are emitted from motor vehicles, chemical plants, refineries, factories, and other industrial sources. NOx is emitted from motor vehicles, power plants, and other sources of combustion.

<u>Potential health impacts</u> – Exposure to ozone can make people more susceptible to respiratory infection, result in lung inflammation, and aggravate pre-existing respiratory diseases such as asthma. Other effects include decrease in lung function, chest pain, and cough.

<u>Unit of measurement</u> – Parts per billion (ppb).

<u>Averaging interval</u> – Highest eight-hour period within a 24-hour period (midnight to midnight) <u>Reduction tips</u> – Curtail daytime driving, refuel cars and use gasoline-powered equipment as late in the day as possible.

### **CO (CARBON MONOXIDE):**

<u>Description</u> – A colorless, odorless, poisonous gas formed when carbon in fuels is not burned completely.

<u>Sources</u> – In cities, as much as 95 percent of all CO emissions emanate from automobile exhaust. Other sources include industrial processes, non-transportation fuel combustion, and natural sources such as wildfires. Peak concentrations occur in colder winter months.

<u>Potential health impacts</u> – Reduces oxygen delivery to the body's organs and tissues. The health threat is most serious for those who suffer from cardiovascular disease.

Unit of measurement – Parts per million (ppm).

Averaging interval – Highest eight-hour period within a 24-hour period (midnight to midnight)

Reduction tips – Keep motor vehicle tuned properly and minimize nighttime driving.

# PM-10 & PM-2.5 (PARTICLES):

<u>Description</u> – The term "particulate matter" (PM) includes both solid particles and liquid droplets found in air. Many manmade and natural sources emit PM directly or emit other pollutants that react in the atmosphere to form PM. Particles less than 10 micrometers in diameter tend to pose the greatest health concern because they can be inhaled into and accumulate in the respiratory system. Particles less than 2.5 micrometers in diameter are referred to as "fine" particles and are responsible for many visibility degradations such as the "Valley Brown Cloud" (see <a href="http://www.phoenixvis.net/">http://www.phoenixvis.net/</a>). Particles with diameters between 2.5 and 10 micrometers are referred to as "coarse".

<u>Sources</u> – Fine = All types of combustion (motor vehicles, power plants, wood burning, etc.) and some industrial processes. Coarse = crushing or grinding operations and dust from paved or unpaved roads.

<u>Potential health impacts</u> – PM can increase susceptibility to respiratory infections and can aggravate existing respiratory diseases, such as asthma and chronic bronchitis.

<u>Units of measurement</u> – Micrograms per cubic meter (ug/m3)

Averaging interval – 24 hours (midnight to midnight).

Reduction tips - Stabilize loose soils, slow down on dirt roads, carpool, and use public transit.

{Updated 12/19/2011}
