# Derecho

- A *derecho* (pronounced similar to "deh-REY-cho") is a widespread, long-lived wind storm that is associated with a band of rapidly moving showers or thunderstorms.
- Although a derecho can produce destruction similar to that of tornadoes, the damage typically is directed in one direction along a relatively straight swath. As a result, the term "straight-line wind damage" sometimes is used to describe derecho damage.
- If the wind damage swath extends more than 240 miles and includes wind gusts of at least 58 mph or greater along most of its length, then the event may be classified as a derecho.

# Significant Wildland Fire Potential Outlook June 2013

## Significant Wildland Fire Potential

	Above Normal		Increasing to Above Normal
	Below Normal		Decreasing to Below Normal
	Normal		Returning to Normal

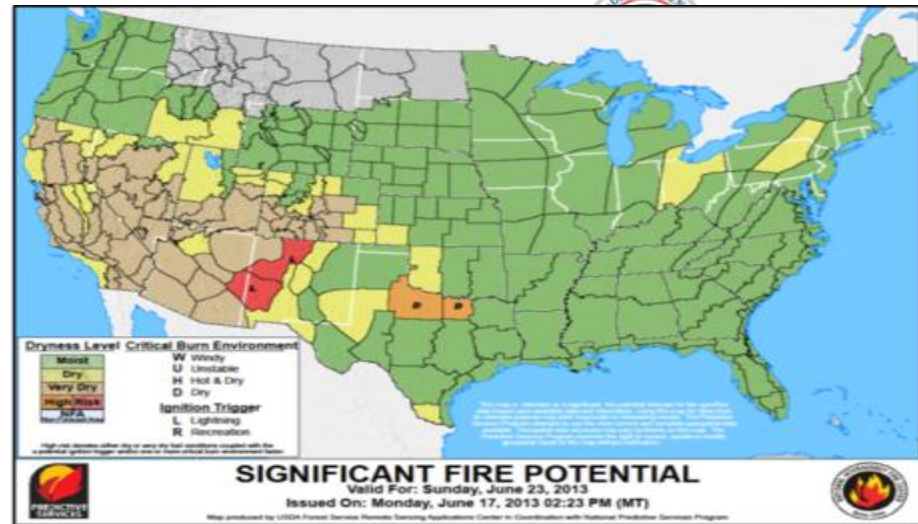

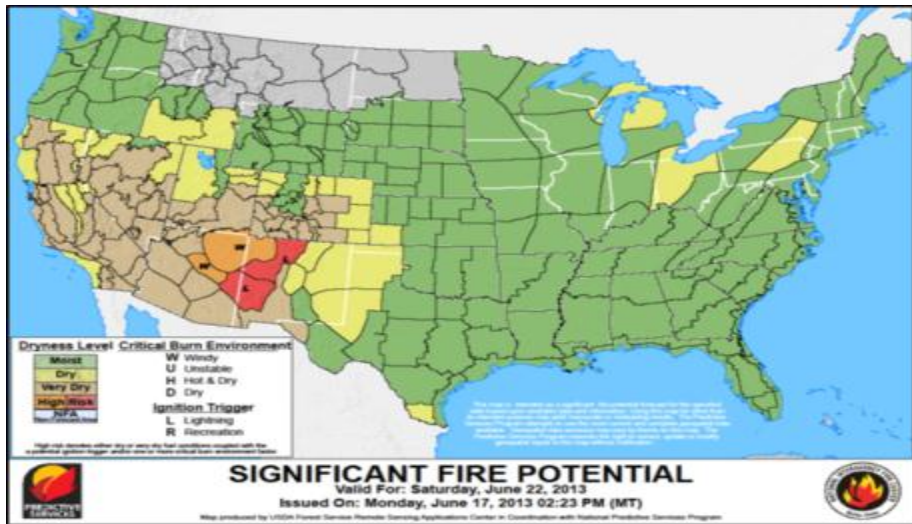

Map produced by  
Predictive Services,  
National Interagency  
Coordination Center  
Boise, Idaho

Issued June 1, 2013  
Next issuance July 1, 2013

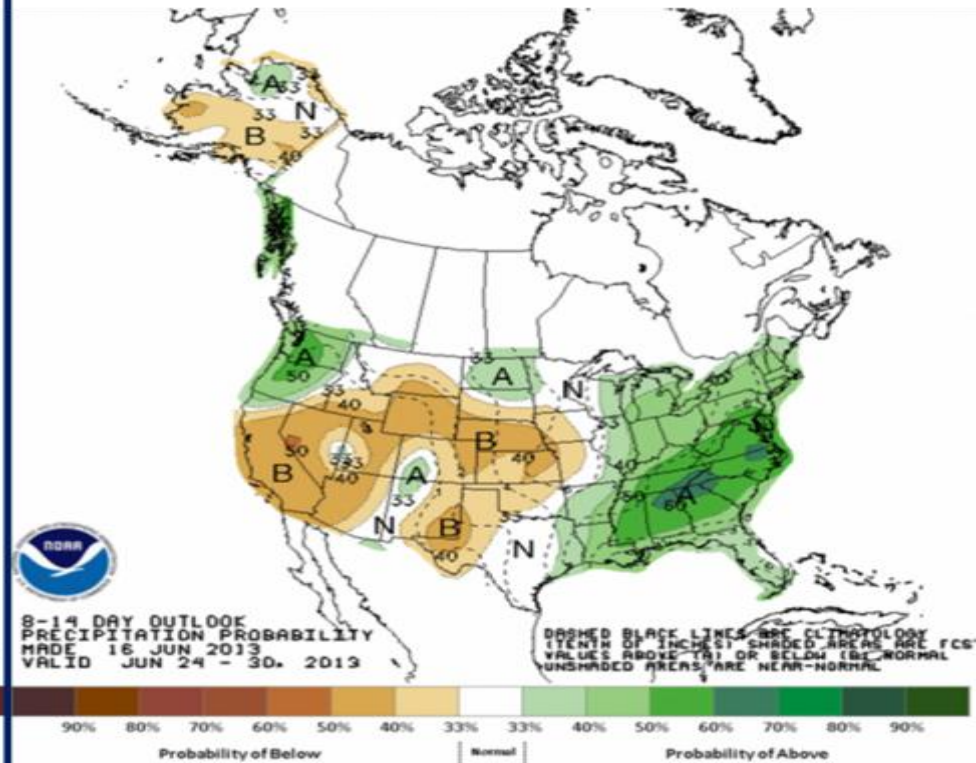

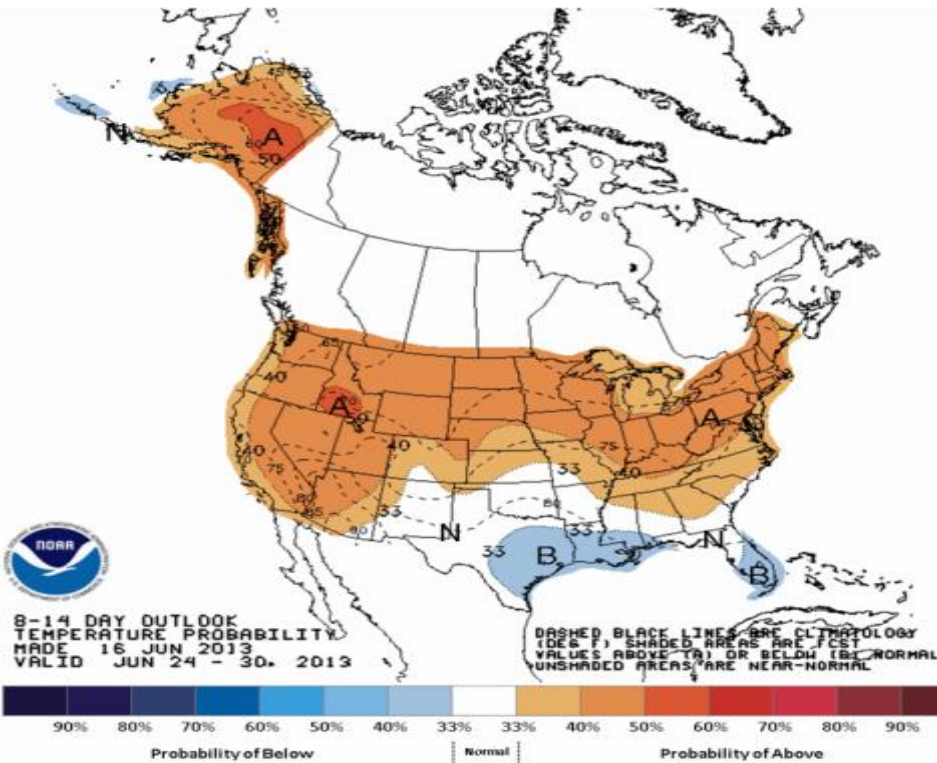

Above normal significant wildland fire potential indicates a higher than usual likelihood that wildland fires will occur and/or become significant events. Wildland fires are still expected to occur during forecasted normal conditions as would usually be expected during the outlook period. Significant wildland fires are still possible but less likely than usual during forecasted below normal periods.

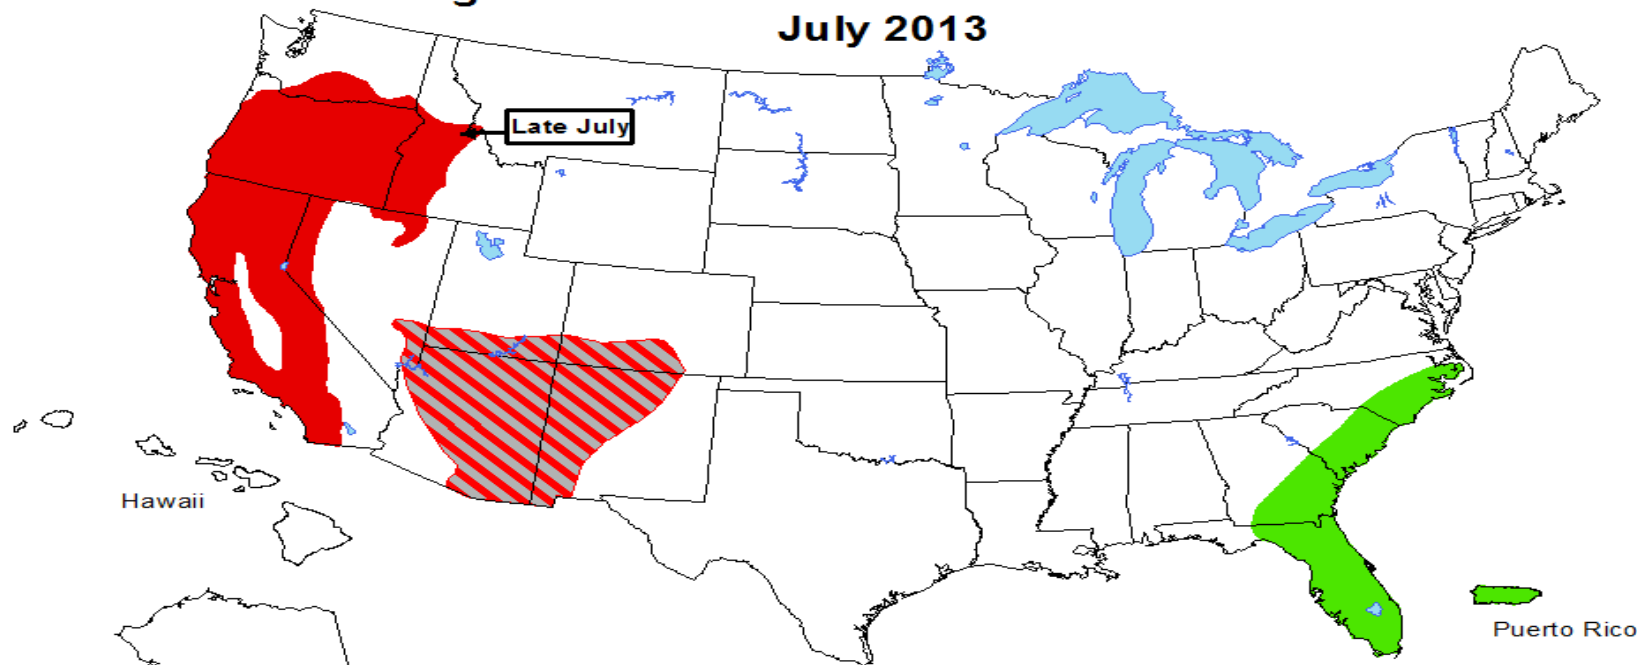

Regardless of fire potential, new fires can start if there is an ignition.  
Where fuels are dangerously dry, fires can spread explosively.
