

Aemetis Opens Bid Proposal Process For \$2B In Offtake Contracts for SAF and RD

February 2, 2021

In California, Aemetis has opened the bid proposal process for \$2 billion of offtake contracts for the launch of the Aemetis “Carbon Zero” plant #1 to commercialize patented technology exclusive to Aemetis for the production of renewable jet fuel and renewable diesel for the aviation and commercial truck markets.

The Aemetis “Carbon Zero 1” plant has a planned capacity of 23 million gallons per year and will be located at the 142-acre Riverbank Industrial Complex, a former US Army ammunitions plant in Riverbank, California.

The patented technology exclusive to Aemetis enables organizations that use jet and diesel fuel such as online marketplaces, package delivery companies, logistics firms and commercial airlines to meet aggressive carbon reduction goals by accelerating their transition away from fossil-based fuels.

The Carbon Zero process converts renewable waste biomass into renewable hydrogen, then uses the renewable hydrogen, solar power, hydro-electric power and low carbon feedstocks to produce zero carbon and drop-in fuels. The jet and diesel fuels may be used in today's airplane, truck, and ship fleets without changes in fueling infrastructure or modified engines.
