

NEWS RELEASE

EMBARGOED UNTIL RELEASE AT 8:30 A.M. EDT, THURSDAY, APRIL 28, 2016

BEA 16-21

GDP: Lisa Mataloni (202) 606-5304 gdpniwd@bea.gov
News Media: Jeannine Aversa (202) 606-2649

GROSS DOMESTIC PRODUCT: FIRST QUARTER 2016 (ADVANCE ESTIMATE)

Real gross domestic product -- the value of the goods and services produced by the nation's economy less the value of the goods and services used up in production, adjusted for price changes -- increased at an annual rate of 0.5 percent in the first quarter of 2016, according to the "advance" estimate released by the Bureau of Economic Analysis. In the fourth quarter, real GDP increased 1.4 percent.

The Bureau emphasized that the first-quarter advance estimate released today is based on source data that are incomplete or subject to further revision by the source agency (see the box on page 3 and "Comparisons of Revisions to GDP" on page 4). The "second" estimate for the first quarter, based on more complete data, will be released on May 27, 2016.

The increase in real GDP in the first quarter reflected positive contributions from personal consumption expenditures (PCE), residential fixed investment, and state and local government spending that were partly offset by negative contributions from nonresidential fixed investment, private inventory investment, exports, and federal government spending. Imports, which are a subtraction in the calculation of GDP, increased.

The deceleration in real GDP in the first quarter reflected a larger decrease in nonresidential fixed investment, a deceleration in PCE, a downturn in federal government spending, an upturn in imports, and larger decreases in private inventory investment and in exports that were partly offset by an upturn in state and local government spending and an acceleration in residential fixed investment.

Upcoming Annual Revision of the National Income and Product Accounts

The annual revision of the national income and product accounts, covering the first quarter of 2013 through the first quarter of 2016, will be released along with the "advance" estimate of GDP for the second quarter of 2016 on July 29. For more information, see the [Technical Note](#).

NOTE. Quarterly estimates are expressed at seasonally adjusted annual rates, unless otherwise specified. Percent changes are calculated from unrounded data and are annualized. "Real" estimates are in chained (2009) dollars. Price indexes are chain-type measures.

This news release is available on [BEA's Web site](#).

Real gross domestic purchases -- purchases by U.S. residents of goods and services wherever produced -- increased 0.9 percent in the first quarter, compared with an increase of 1.5 percent in the fourth.

The **price index for gross domestic purchases**, which measures prices paid by U.S. residents, increased 0.3 percent in the first quarter, compared with an increase of 0.4 percent in the fourth. Excluding food and energy prices, the price index for gross domestic purchases increased 1.4 percent, compared with an increase of 1.0 percent.

Current-dollar GDP -- the market value of the goods and services produced by the nation's economy less the value of the goods and services used up in production -- increased 1.2 percent, or \$56.3 billion, in the first quarter to a level of \$18,221.1 billion. In the fourth quarter, current-dollar GDP increased 2.3 percent, or \$104.6 billion.

Disposition of personal income

Current-dollar personal income increased \$130.8 billion in the first quarter, compared with an increase of \$117.4 billion in the fourth. The acceleration in personal income primarily reflected an upturn in personal interest income and an acceleration in personal current transfer receipts that were partly offset by a downturn in personal dividend income.

Personal current taxes increased \$24.3 billion in the first quarter, compared with an increase of \$28.4 billion in the fourth.

Disposable personal income increased \$106.5 billion, or 3.2 percent, in the first quarter, compared with an increase of \$89.0 billion, or 2.7 percent, in the fourth. **Real disposable personal income** increased 2.9 percent, compared with an increase of 2.3 percent.

Personal outlays increased \$72.5 billion in the first quarter, compared with an increase of \$90.9 billion in the fourth.

Personal saving -- disposable personal income less personal outlays -- was \$712.3 billion in the first quarter, compared with \$678.3 billion in the fourth.

The **personal saving rate** -- personal saving as a percentage of disposable personal income -- was 5.2 percent in the first quarter, compared with 5.0 percent in the fourth. For a comparison of personal saving in BEA's national income and product accounts with personal saving in the Federal Reserve Board's financial accounts of the United States and data on changes in net worth, go to www.bea.gov/national/nipaweb/Nipa-Frb.asp.

Information on the assumptions used for unavailable source data is provided in a technical note that is posted with the news release on BEA's Web site. Within a few days after the release, a detailed "Key Source Data and Assumptions" file is posted on the Web site. In the middle of each month, an analysis of the current quarterly estimate of GDP and related series is made available on the Web site; click on *Survey of Current Business*, "GDP and the Economy." For information on revisions, see "[Revisions to GDP, GDI, and Their Major Components](#)."

BEA's national, international, regional, and industry estimates; the *Survey of Current Business*; and BEA news releases are available without charge on BEA's Web site at www.bea.gov. By visiting the site, you can also subscribe to receive free e-mail summaries of BEA releases and announcements.

* * *

Next release -- May 27, 2016 at 8:30 A.M. EDT for:
Gross Domestic Product: First Quarter 2016 (Second Estimate)
Corporate Profits: First Quarter 2016 (Preliminary Estimate)

Comparisons of Revisions to GDP

Current quarterly estimates of GDP are released on the following schedule: "Advance" estimates, based on source data that are incomplete or subject to further revision by the source agency, are released near the end of the first month following the end of the quarter; as more detailed and more comprehensive data become available, "second" and "third" estimates are released near the end of the second and third months, respectively. "Latest" quarterly estimates reflect the results of both annual and comprehensive revisions, which are typically released in late July.

Annual revisions generally cover at least the 3 most recent calendar years (and the associated quarters) and incorporate newly available major annual source data. Comprehensive (or benchmark) revisions are carried out at about 5-year intervals and incorporate major periodic source data, as well as improvements in concepts and methods that update the accounts to portray more accurately the evolving U.S. economy.

The table below presents the average revisions to the quarterly percent changes in real and current-dollar GDP for the different estimate vintages. From the advance estimate to the second estimate (1 month later), the average revision to real GDP growth without regard to sign is 0.5 percentage point, while from the advance estimate to the third estimate (2 months later), it is 0.6 percentage point. From the advance estimate to the latest estimate, the average revision without regard to sign is 1.2 percentage points. Larger average revisions for the latest estimates reflect the fact that comprehensive revisions include major improvements to the accounts, such as the incorporation of BEA's latest benchmark input-output accounts. The current quarterly estimates correctly indicate the direction of change in real GDP 96 percent of the time, correctly indicate whether GDP is accelerating or decelerating about 75 percent of the time, and correctly indicate whether real GDP growth is above, near, or below trend growth about 83 percent of the time.

Revisions to Quarterly Percent Changes of GDP: Vintage Comparisons

[Annual rates]

Vintages compared	Average	Average without regard to sign	Standard deviation of revisions without regard to sign
Real GDP			
Advance to second	0.1	0.5	0.4
Advance to third	0.1	0.6	0.5
Second to third	0.0	0.2	0.3
Advance to latest	-0.1	1.2	1.0
Current-dollar GDP			
Advance to second	0.1	0.5	0.4
Advance to third	0.2	0.7	0.5
Second to third	0.1	0.3	0.3
Advance to latest	0.1	1.3	1.0

These comparisons are based on the period from 1993 through 2014.

1. Real gross domestic income is gross domestic income deflated by the implicit price deflator for gross domestic product.
 NOTE: Users are cautioned that particularly for components that exhibit rapid change in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series. For accurate estimates of the contributions to percent changes in real gross domestic product, use table 2.
 See Explanatory Note at the end of the tables.

1. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

2. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households. Percentage changes for these series are included in the addenda to table 8 and appendix table A. See *Explanatory Note* at the end of the tables.

1. Gross domestic income deflated by the implicit price deflator for gross domestic product.

2. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

3. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

See *Explanatory Note* at the end of the tables.

1. Personal income is also equal to national income less corporate profits with inventory valuation and capital consumption adjustments, taxes on production and imports less subsidies, contributions for government social insurance, net interest and miscellaneous payments, business current transfer payments (net), and current surplus of government enterprises, plus personal income receipts on assets, and personal current transfer receipts.

2. The current-dollar measure is deflated by the implicit price deflator for personal consumption expenditures.

1. For some components of final sales of computers, includes computer parts.
2. Farm output less intermediate goods and services purchased.
3. Consists of GDP less gross value added of farm, of households and institutions, and of general government.
4. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.
5. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.
See *Explanatory Note* at the end of the tables.

Explanatory Note: NIPA Measures of Quantities and Prices

Current-dollar GDP is a measure of the market value of goods, services, and structures produced in the economy in a particular period. Changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or "real" measures, and prices are expressed as index numbers with the reference year -- at present, the year 2009 -- equal to 100.

Annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent years. (Quarterly changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent quarters; quarterly indexes are adjusted for consistency to the annual indexes before percent changes are calculated.) For example, the 2008-09 annual percent change in real GDP uses prices for 2008 and 2009 as weights, and the 2008-09 annual percent change in GDP prices uses quantities for 2008 and 2009 as weights. These annual changes are "chained" (multiplied) together to form time series of quantity and price indexes. Percent changes in Fisher indexes are not affected by the choice of reference year. (BEA also publishes a measure of the price level known as the implicit price deflator (IPD), which is calculated as the ratio of the current-dollar value to the corresponding chained-dollar value, multiplied by 100. The values of the IPD are very close to the values of the corresponding "chain-type" price index.)

Index numbers of quantity and price indexes for GDP and its major components are presented in this release in tables 5 and 6. Percent changes from the preceding period are presented in tables 1, 4, 7, 8, and appendix table A. Contributions by major components to the percent change in real GDP are presented in table 2.

Measures of real GDP and its major components are also presented in dollar-denominated form, designated "chained (2009) dollar estimates." For most series, these estimates, which are presented in table 3, are computed by multiplying the current-dollar value in 2009 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2009 and if real output for this component increased 10 percent in 2010, then the chained (2009) dollar value of this component in 2010 would be \$110 ($= \$100 \times 110 / 100$). Percent changes calculated from chained-dollar estimates and from chain-type quantity indexes are the same; any differences will be small and due to rounding.

Chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate). This is because the relative prices used as weights for any period other than the reference year differ from those of the reference year. A measure of the extent of such differences is provided by a "residual" line, which indicates the difference between GDP (or other major aggregate) and the sum of the most detailed components in the table. For periods close to the reference year, when there usually has not been much change in the relative prices that are used as weights, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. Thus, the contributions to percent change shown in table 2 provide a better measure of the composition of GDP growth. In particular, for components for which relative prices are changing rapidly, calculation of contributions using chained-dollar estimates may be misleading even just a few years from the reference year.
