**WA Pharmacy Quality Assurance Commission
Pharmacy Self-Inspection Worksheet**

2023/20242025 USP 797 – Sterile Compounding Addendum

Attention: Responsible Pharmacy Manager or Equivalent Manager

Washington law holds the responsible manager (or equivalent manager) and all pharmacists on duty responsible for ensuring pharmacy compliance with all state and federal laws governing the practice of pharmacy. Failure to complete this addendum within the month of March and within 30 days of becoming responsible manager (as required by WAC 246-945-005) may result in disciplinary action. The following addendum is required to be filled out and kept on file with the General Pharmacy or Hospital Pharmacy Self-Inspection Worksheet. **Do not send to the commission office.**

The primary objective of this report, and your self-inspection, is to provide an opportunity to identify and correct areas of non-compliance with state and federal law. This worksheet does not replace U.S. Pharmacopeia (USP) <797> Pharmaceutical Compounding – Sterile Preparations. (**Note:** Neither the self-inspection nor a commission inspection evaluates your complete compliance with all laws and rules of the practice of pharmacy.)

By answering the questions and referencing the appropriate laws/rules/CFR provided, you can determine whether you are compliant with many of the rules and regulations. If you have corrected any deficiencies, please write corrected and the date of correction by the appropriate question.

Compounding does not include mixing, reconstituting, or other such acts that are performed in accordance with directions contained in approved labeling or supplemental materials provided by the product's manufacturer. Preparing a conventionally manufactured sterile product in accordance with the directions in the manufacturer's approved labeling is out of scope of this chapter only if: 1. The product is prepared as a single dose for an individual patient; and 2. The approved labeling includes information for the diluent, the resultant strength, the container closure system, and storage time.

Date responsible manager/change of responsible manager inspection was performed: Click or tap to enter a date.

Signature of responsible pharmacy manager: Click or tap here to enter text.

General Rule Reference - Applies to all questions through worksheet.

RCW 18.64.270(2) "Any medicinal products that are compounded for patient administration or distribution to a licensed practitioner for patient use or administration shall, at a minimum, meet the standards of the official United States pharmacopeia as it applies to nonsterile products and sterile administered products."

To request this document in another format, call 1-800-525-0127. Deaf or hard of hearing customers, please call 711 (Washington Relay) or email doh.information@doh.wa.gov.

Please Note: When determining compliance with a question that has multiple requirements, if the facility is NOT compliant with any single requirement in the question check the "No" compliance box. Include an explanation of which part is noncompliant in the "Notes/Corrective Actions" column. Checking the "Yes" compliance box indicates compliance with all requirements in a question.

Does the pharmacy engage in compounding with hazardous drugs?
 If yes, you must also complete the 2025⁴ USP 800 – Hazardous Drugs Addendum

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	3.	<p>USP <797> 1.3 Immediate-Use CSPs When all of the following conditions are met, compounding of CSPs for direct and immediate administration is not subject to the requirements for Category 1, Category 2, or Category 3 CSPs:</p> <ol style="list-style-type: none"> 1. Aseptic techniques, processes, and procedures are followed, and written SOPs are in place to minimize the potential for contact with nonsterile surfaces, introduction of particulate matter or biological fluids, and mix-ups with other conventionally manufactured products or CSPs. 2. Personnel are trained and demonstrate competency in aseptic processes as they relate to assigned tasks and the facility's SOPs. 3. The preparation is performed in accordance with evidence-based information for physical and chemical compatibility of the drugs (e.g., approved labeling, stability and compatibility studies). 4. The preparation involves not more than 3 different sterile products. 5. Any unused starting component from a single-dose container must be discarded after preparation is complete. Single-dose containers must not be used for more than one patient. 6. Administration begins within 4 h following the start of preparation. If administration has not begun within 4 h following the start of preparation, it must be promptly, appropriately, and safely discarded. 7. Unless directly administered by the person who prepared it or administration is witnessed by the preparer, the CSP must be labeled with the names and amounts of all active ingredients, the name or initials of the person who prepared the preparation, and the 4-h time period within which administration must begin. 	Click or tap here to enter text.
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	4.	<p>USP <797> 1.4 Preparation Per Approved Labeling Proprietary bag and vial systems: Docking and activation of proprietary bag and vial systems in accordance with the manufacturer's labeling for immediate administration to an individual patient is not considered compounding and may be performed outside of an International Organization for Standardization (ISO) Class 5 environment. Docking of the proprietary bag and vial systems for future activation and administration is considered compounding and must be performed in an ISO Class 5 environment in accordance with this chapter, with the exception of 14. Establishing Beyond-Use Dates. Beyond-use dates (BUDs) for proprietary bag and vial systems must not be longer than those specified in the manufacturer's labeling.</p>	Click or tap here to enter text.

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	5.	<p>USP <797> 1.5 CSP Categories If one or more of the starting components being used to compound is not sterile, the sterility of the compounded preparation must be achieved through a sterilization process (e.g., terminal sterilization in the final sealed container) or sterilizing filtration, and then sterility must be maintained if the CSP is subsequently manipulated. When compounding with nonsterile starting components, supplies, or equipment, the quality of the components, the effectiveness of the sterilization step, and bacterial endotoxin mitigation strategies are critical to achieving a sterile preparation that is free from excessive bacterial endotoxins.</p>	Click or tap here to enter text.

Personnel Training and Evaluation

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	6.	<p>2. PERSONNEL TRAINING AND EVALUATION All personnel who compound or have direct oversight of compounding personnel must be initially trained and qualified by demonstrating knowledge and competency in compounding CSPs according to the requirements in this section before being allowed to perform their job functions independently. Designated person(s) are responsible for creating and implementing a training program for personnel and for ensuring that compounders, personnel who have direct oversight of compounders, and personnel who perform restocking or cleaning and disinfection duties are initially trained and qualified by demonstrating knowledge and competency in maintaining the quality of the sterile compounding environment before being allowed to perform their job functions independently. Personnel who compound or have direct oversight of compounding personnel must complete training initially and at least every 12 months in appropriate sterile compounding principles and practices as described below (see 2.1 <i>Demonstrating Knowledge and Competency of Core Skills</i>). Personnel who only perform restocking or cleaning and disinfecting duties outside of the primary engineering control (PEC) must complete ongoing training as required by the facility's SOPs. Each compounding facility must develop a written training program that describes the required training, the frequency of training, and the process for evaluating the performance of individuals who compound, have direct oversight of compounding personnel, perform in-process checks, final verification, and dispensing of CSPs.</p>	Click or tap here to enter text.

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	8.	<p>2.2 Demonstrating Competency in Garbing and Hand Hygiene Before beginning to compound Category 1, Category 2, or Category 3 CSPs or have direct oversight of compounding personnel, personnel must successfully complete an initial garbing competency evaluation no fewer than 3 separate times. The 3 successful completions must be in succession—failure of any of the 3 initial garbing competency evaluations requires repeat testing until personnel successfully complete 3 evaluations in a row. The garbing competency evaluation consists of a visual observation and gloved fingertip and thumb sampling (GFT) of both hands (see <i>Box 1</i>). Each of the 3 initial competency evaluations must occur after performing a separate and complete hand hygiene and full garbing procedure. All garbing competencies must be completed with gloved fingertip and thumb sampling after garbing (see <i>Box 1</i>) and a documented visual audit while performing hand hygiene and garbing procedures (see 3. <i>Personal Hygiene and Garbing</i>). Gloved fingertip and thumb sampling after garbing, but before applying sterile 70% IPA to gloves, must be performed on donned sterile gloves on both hands in a classified area or segregated compounding area (SCA).</p>	Click or tap here to enter text.
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	9.	<p>2.2 Demonstrating Competency in Garbing and Hand Hygiene Failure is indicated by visual observation of improper hand hygiene and garbing procedures and/or gloved fingertip and thumb sampling results that exceed the action levels in <i>Table 1</i>. Results of the evaluation and corrective actions, in the event of failure, must be documented and the documentation maintained to provide a record and long-term assessment of personnel competency.</p>	Click or tap here to enter text.
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	10.	<p>2.2 Demonstrating Competency in Garbing and Hand Hygiene Documentation must at a minimum include the name of the person evaluated; evaluation date and time; media and components used including manufacturer, expiration date, and lot number; starting temperature for each interval of incubation; dates of incubation; results and identification of the observer and personnel reading and documenting the results. Microbial identification of the colony-forming units (cfu) is not required for gloved fingertip and thumb sampling.</p>	Click or tap here to enter text.

Sterilization and Depyrogenation					
If the facility compounds preparations from nonsterile components or if the compounded preparation comes into contact with nonsterile devices, please complete the Sterilization and Depyrogenation section of the worksheet. If the facility does not engage in these activities, please skip this section, and continue with the next section Master Formulation and Compounding Records.					
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	106.	<p>USP <797> 10. Sterilization and Depyrogenation Injectable compounded preparations that contain nonsterile components or that come into contact with nonsterile devices (e.g., containers, tubing) during any phase of the compounding procedure must be sterilized within 6 h after completing the preparation to minimize the generation of bacterial endotoxins in CSPs. A description of the terminal sterilization and depyrogenation process, including the temperature, pressure (if applicable), duration, permissible load conditions for each cycle, and the use of biological indicators and endotoxin challenge vials (ECVs) must be included in the facility's SOPs. SOPs must include training and competency of personnel on all sterilization methods and equipment used by the facility. In addition, the SOPs must include a schedule and method for establishing and verifying the effectiveness of the terminal sterilization and depyrogenation methods selected, as well as the methods for maintaining and cleaning the sterilizing and depyrogenation equipment.</p>	Click or tap here to enter text.
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	107.	<p>USP <797> 10.1 Depyrogenation Dry heat depyrogenation must be used to render glassware, metal, and other thermostable containers and components pyrogen free. The duration of the exposure period must include sufficient time for the items to reach the depyrogenation temperature. The items must remain at the depyrogenation temperature for the duration of the depyrogenation period. The effectiveness of the dry heat depyrogenation cycle must be established initially and verified annually using ECVs to demonstrate that the cycle is capable of achieving a ≥3-log reduction in endotoxins (see Bacterial Endotoxins Test (85)). The effectiveness of the depyrogenation cycle must be re-established if there are changes to the depyrogenation cycle described in SOPs (e.g., changes in load conditions, duration, or temperature). This verification must be documented. Items that are not thermostable must be depyrogenated by multiple rinses with sterile, nonpyrogenic water (e.g., <i>Sterile Water for Injection</i> or <i>Sterile Water for Irrigation</i>) and then thoroughly drained or dried immediately before use in compounding See <i>Depyrogenation by Rinsing</i> (1228.4).</p>	Click or tap here to enter text.

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	108.	<p>USP <797> 10.2 Sterilization by Filtration Sterilizing filters must be sterile, depyrogenated, have a nominal pore size of 0.22 µm or smaller, and be appropriate for pharmaceutical use. Sterilizing filters with labeling that states “for laboratory use only” or a similar statement must not be used for compounding CSPs. Sterilizing filters must be certified by the manufacturer to retain at least 107 microorganisms of a strain of <i>Brevundimonas diminuta</i> per square centimeter of upstream filter surface area under conditions similar to those in which the CSPs will be filtered (i.e., pressure, flow rate, and volume filtered). The designated person(s) must ensure—from available published information, from supplier documentation, or through direct challenge (e.g., filtering the CSP)—that the filters 1) are chemically and physically compatible with all ingredients in the CSP (e.g., water-miscible alcohols may damage filter integrity); 2) are chemically stable at the pressure and temperature conditions that will be used; and 3) have enough capacity to filter the required volumes. Filter units used to sterilize CSPs must be subjected to the manufacturers’ recommended integrity testing, such as a post-use bubble point test. If multiple filters are required for the compounding process, each of the filters must pass a filter-integrity test. When CSPs are known to contain excessive particulate matter, a prefiltration step must be performed using a filter of larger nominal pore size (e.g., 1.2 µm) or a separate filter of larger nominal pore size should be placed upstream of (i.e., prior to) the sterilizing filter to remove gross particulate contaminants before the CSP is passed through the sterilizing-grade filter</p>	Click or tap here to enter text.
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	109.	<p>USP <797> 10.2 Sterilization by Filtration CSPs that were prepared using a filter that failed integrity tests must be discarded or, after investigating the cause of the failure and selection of an appropriate filter, refiltered for sterilization not more than one additional time.</p>	Click or tap here to enter text.

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	110.	<p>USP <797> 10.3 Sterilization by Steam Heat To achieve sterility when steam sterilization is used, all materials must be directly exposed to steam under adequate pressure for the length of time necessary, as determined by use of appropriate biological indicators, to render the items sterile (e.g., 20–60 min at 121° saturated steam under a pressure of 15 psi, depending on the volume or size of the CSP being sterilized). The duration of the exposure period must include sufficient time for the entire contents of the CSP and other items to reach the sterilizing temperature. The CSP and other items must remain at the sterilizing temperature for the duration of the sterilization period. CSPs must be placed in the autoclave to allow steam to reach the CSPs without entrapment of air. Flat, stainless-steel trays with low sides or ventilated bottoms will permit steam contact. When preparing items that must be wrapped for steam sterilization, wrap them in low-lint protective fabric or paper or seal in envelopes that will permit steam penetration and are designed to minimize the risk of post-sterilization microbial contamination. For CSPs, immediately before filling containers that will be steam sterilized, solutions must be passed through a filter with a nominal pore size of not larger than 1.2 µm for removal of particulate matter. Sealed containers must be able to generate steam internally. Stoppered and crimped empty vials must contain a small amount of sterile water to generate steam.</p>	Click or tap here to enter text.
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	111.	<p>USP <797> 10.3 Sterilization by Steam Heat The effectiveness of steam sterilization must be verified and documented with each sterilization run or load by using appropriate biological indicators, such as spores of <i>Geobacillus stearothermophilus</i> (ATCC 12980, ATCC 7953, or equivalent; see <i>Biological Indicators for Sterilization</i> (1229.5)), and other confirmation methods such as physicochemical indicators (see <i>Physicochemical Integrators and Indicators for Sterilization</i> (1229.9)).</p>	Click or tap here to enter text.
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	112.	<p>USP <797> 10.3 Sterilization by Steam Heat The steam supplied must be generated using water per the manufacturer’s recommendation. A calibrated data recorder or chart must be used to monitor each cycle and to examine for cycle irregularities (e.g., deviations in temperature or pressure). The date, run, and load numbers of the steam sterilizer used to sterilize a CSP must be documented in the CR.</p>	Click or tap here to enter text.

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	113.	Does the process of dry heat sterilization meet all requirements?	<p>USP <797> 10.4 Sterilization by Dry Heat The CSP and other items must remain at the sterilizing temperature for the duration of the sterilization period. Immediately before filling ampules and vials that will be sterilized by dry heat, CSP solutions must be passed through a filter with a nominal pore size of not larger than 1.2 µm for removal of particulate matter. Dry heat sterilization is usually performed in an oven designed for sterilization at 160° or higher. If lower temperatures are used, they must be shown to achieve effective sterilization (see (1229.8), Validation of Dry Heat Sterilization, Biological Indicators). Heated air must be evenly distributed throughout the chamber, which is typically accomplished by an air blower. The calibrated oven must be equipped with temperature controls and a timer. During sterilization, sufficient space must be left between materials to allow for circulation of the hot air. A calibrated data recorder or chart must be used to monitor each cycle and the data must be reviewed to identify cycle irregularities (e.g., deviations in temperature or exposure time). The effectiveness of the dry heat sterilization method must be verified and documented with each sterilization run or load using appropriate biological indicators such as spores of <i>Bacillus atrophaeus</i> (ATCC 9372; see (1229.5)) and other confirmation methods (e.g., temperature-sensing devices). The date, run, and load numbers of the dry heat oven used to sterilize a CSP must be documented in the CR.</p>	Click or tap here to enter text.
Master Formulation and Compounding Records
